

Accu- Vis Feasibility Evaluation

June 22, 2026

Proposed design: Feature Feasibility Evaluation

Linsear Guide

- Allows the phone holder to move **forward and backward**.
- Possible usage of motor either **Stepper or Servo**.
- May cause **heavier** mass due to motor's existence.

Linear guide (rail) sample

Occluder

- Can **change the placement** from side to side using linear sliding technique.
- Can make a design to properly **isolate** the eye cover when in-use.

Pivot Connector

- This type of approach is **not practical and will not even work.**
- The design for this must be **through and through** the linear paths to adjust the height and length of the prototype.

Suggested approach

Chin Rest

- Can create a design base on the **eye to chin distance** of each heads.
- Possible knob adjusted approach just like the idea on pivot connector.

Phone Holder

- Designed to hold the phone to be used in the test.
- Will be designed according to the attachments of the linear guide's design. (brand design specifications)

Part and feature Evaluations: (Major Features Only)

Remarks : Feasible, Impractical and Unsure

- Linear Guide
- Occluder
- Pivot Connector (will find and suggest another approach)
- Chin Rest
- Phone Holder
